PROFESSIONAL EXPERTISE

My expertise lies in the development and deployment of efficient methods for computing on encrypted data, i.e. secure multiparty computation protocols. Central to my success has been a holistic approach to the design, security analysis, and implementation of these protocols. Notable contributions are as follows.

Efficient methods for performing Private Set Intersection and encrypted database joins. In its simplest form, this technology allows two parties to identify common elements between sets held by each party without revealing any additional information. The protocols developed represent state of the art in a number of settings, e.g. semi-honest, malicious, honest majority, secret shared inputs, unbalanced sets. As a testament of the research, these protocols are currently deployed both within Visa and externally such as in the Microsoft Edge password manager.

Another area of focus has been the development of threshold cryptography. This line of research became a focus with the design of the DiSE protocol, the first highly efficient threshold scheme for authenticated encryption. This design has been further refined in the recent ParaDiSE protocol which offers more fine grained control and security guarantees. In addition, I have been the technical lead for implementing and deploying this technology at Visa for encryption, key management, and signing with threshold ECDSA.

Other areas of note include the design and implementation of efficient state of art methods for privacy preserving machine learning, i.e. regression, neural networks, decision trees. I lead the development of this technology at Visa with the goal to enable responsible data sharing with industry partners. Another Visa inspired application is privacy preserving biometric authentication where a client, e.g. card holder, wishes to authenticate to a server, e.g. Visa, using their biometrics without revealing the biometrics.

Finally, the development and security analysis of highly efficient low level cryptographic primitives, most notably Oblivious Transfer. In this area I have designed several of the state of art protocols (i.e. Endemic OT, Silent OT, Expand Convolute) and identified security vulnerabilities in existing constructions. In addition, I am the author of the industry leading open source library for performing efficient oblivious transfer.

EDUCATION

Ph.D. in Computer Science
Oregon State University, Corvallis

January 2015 — Est. Sep. 2018

M.S. in Computer Science
Oregon State University, Corvallis

January 2015 — Sep. 2017

B.S. in Computer Science
Oregon State University, Corvallis

September 2010 — June 2014

EMPLOYMENT

Visa Research
Staff Research Scientist

August 2018 — present
San Francisco, CA

Oregon State University
Graduate Research Assistant

January 2015 — August 2018
Corvallis, OR

Visa Research
Security Research Intern

June 2017 — September 2017
Palo Alto, CA

Microsoft Research
Security Research Consultant

January 2017 — June 2017

Microsoft Research
Security Research Intern

June 2016 — September 2016
January 2016 — March 2016
Redmond, WA

Digimarc
Software Developer Intern

June 2014 — December 2014
Portland, OR

Boeing Company
Software Developer Intern

March 2013 — September 2013
Portland, OR
